Summary

Software Engineer specializing in applied generative AI, architecting production-grade multi-agent workflows, and building high-performance observability and evaluation pipelines on cloud infrastructure.

EDUCATION

Lehigh University

Bachelor's in Computer Science

May 2025

SKILLS

- **AI Architecture & Agents:** Multi-Agent Systems (Sequential pipelines), Model Context Protocol (MCP), LLM-as-a-judge evaluation, Retrieval-Augmented Generation (RAG).
- **Observability & Cloud:** OpenTelemetry (GenAI Semantic Conventions), Google Cloud Trace, Workload Identity Federation (WIF), PostgreSQL, pgvector.
- **Engineering Stack:** Python (FastAPI, FastMCP), TypeScript, React/Next.js.

PROJECT

TeamFlow: AI-Powered Job screener | team-floww.vercel.app/ | github.com/rubiabExe/TeamFlow | Python, FastMCP, pgvector, Gemini 1.5 Pro, OpenTelemetry

- Architected an enterprise-grade hiring orchestrator, transitioning the system from a monolithic script to a Sequential Multi-Agent Pipeline, decoupling the neural OCR extraction layer from the semantic evaluation engine.
- Implemented a Model Context Protocol (MCP) server utilizing Python (FastMCP), exposing secure database tools and candidate context to the LLM agent to resolve tool integration complexities.
- Secured cloud deployments by configuring Workload Identity Federation (WIF) to authenticate GitHub Actions CI/CD pipelines via short-lived OIDC tokens, deprecating long-lived service account JSON keys.
- Instrumented the Python microservice with OpenTelemetry GenAI Semantic Conventions, capturing LLM-native metrics (token usage, operation duration) and exporting distributed traces to Google Cloud Trace.

Managify | managii.vercel.app/ | github.com/rubiabExe/Managify | Next.js, TypeScript, Python, PostgreSQL, Google Cloud SQL, Prisma ORM, Claude Code, Antigravity

- Developed a scalable, AI-powered workflow automation system to synthesize job board contexts and tailor applicant documentation, backed by Google Cloud SQL for relational entity state management.
- Built a custom LLM-as-a-judge evaluation harness to validate generative outputs. Deployed low-temperature models to automatically score outputs for Context Relevance and Groundedness against a curated golden set to mitigate hallucinations.
- Engineered a dedicated Python background service to handle dynamic LaTeX compilation, isolating heavy computational processing from the Next.js frontend to ensure sub-second UI responsiveness.

SOFTWARE ENGINEERING EXPERIENCE:

Software Engineer | *Stealth Startup* | *New York, NY*

May 2024 - August 2024

- Led the end-to-end frontend lifecycle for a pre-seed generative productivity application using React and TypeScript, translating technical discovery sessions with business stakeholders into responsive UX elements.
- Architected secure data fetching pipelines interfacing with cloud-deployed LLM microservices, writing optimized SQL queries and enforcing strict access controls to ensure client data isolation.
- Accelerated system development by 40% by strategically balancing custom-built state management with off-the-shelf component libraries (Mantine).

Software Engineering Intern | *Mentessa* | *San Francisco, CA*

May 2023 - Aug 2023

- Partnered with cross-functional engineering leads to deploy a production-grade generative AI solution, integrating the OpenAI API into a corporate Slack environment to automate contextual knowledge retrieval.
- Designed custom React components and Slack Block Kit workflows to reliably render complex, structured JSON outputs from the LLM, lifting the deterministic query success rate by 20%.
- Owned the frontend deployment strategy, shipping a responsive interface that drove a 30% increase in core user engagement across the enterprise client base.
